

- all fields and methods in DataHealthSimulator are underlined because they are static
- the relation is composition because the generators are created by HealthDataSimulator and they do not exist without it, and all of them have 1 to 1 cardinality because there is only 1 HealthDataSimulator and it creates only 1 of each generators

The relations between TcpOutputStrategy, ConsoleOutputStrategy, FileOutputStrategy, WebSocketOutputStrategy and OutputStrategy is realization, because all of those classes implement OutputStrategy interface. Similarly, all the Generator classes are implementing PatientDataGenerator interface, through realization.
